

Competitive Analysis — Indian Wealth Tracking & Advisory Market

Built using the *discover-competitive-analysis* skill format.

1. Overview

Scope: Overall product positioning and feature/data-access strategy for a multi-asset wealth management & portfolio tracking platform for the Indian market (web-first, phase 1). This analysis covers all 7 competitors explicitly named by the PM — more than the skill's standard 3–5, kept intentionally comprehensive since all seven are confirmed, real, live products the team is already tracking.

Why now: We're mid-build on the MF import module and about to lock the August roadmap. This analysis exists to answer: where is the crowded middle of this market, and where is the actual whitespace we should build toward.

2. Market Context

India's personal wealth-tracking market has split into three distinct plays over the last few years:

1. **Accounting-depth trackers** (Mprofit) — legacy players who built deep tax/XIRR/capital-gains engines on top of fragile PDF/Excel parsing, pre-dating the Account Aggregator (AA) framework.
2. **AA-native aggregators** (Passbook.ai, Famli, increasingly Safebox) — newer entrants building on RBI's AA framework (live since 2021) as the default data-access layer, trading some accounting depth for breadth and consent-based real-time sync.
3. **MF-native advisory/investing apps** (Kuvera, PowerUp Money) — these aren't primarily trackers; they're distribution/advisory businesses that happen to show you a portfolio because you invest or get advice through them.

The regulatory thread running through all of them: **every credible player above is either an AMFI-registered MFD, a SEBI RIA, or actively becoming one.** Software-only, unregistered aggregation without a data-access or advice license is not how this market is being built right now — that's the single most important structural fact from this research.

3. Competitors Analyzed

#	Competitor	Type	Included because
1	Mprofit	Direct	The explicit north star / primary benchmark for this build
2	Famli	Direct	Named competitor, closest analog on "family wealth + AI insights"
3	Passbook.ai	Direct	Named competitor, broadest asset coverage, AA-native
4	Kuvera (by CRED)	Indirect	Named competitor; primarily an investing app, tracking is secondary
5	NGEN Markets	Indirect / reference	Named; B2B research tool, not a retail tracker — useful as a feature reference, not a true competitor
6	Safebox	Direct	Named competitor; adjacent job (document vault + net worth vs. deep accounting)
7	PowerUp Money	Indirect	Named competitor; MF-only advisory, not a multi-asset tracker

4. Feature Comparison Matrix

Rated Full / Partial / None / Unknown based on public sources only.

Capability	Mprofit	Famli	Passbook.ai	Kuvera	NGEN Markets	Safebox	PowerUp Money
Multi-asset coverage (MF+equity+FD+property+gold etc.)	Full	Partial (MF, bank, insurance, loans, cards)	Full (broadest — incl. crypto, chits, pension)	Partial (MF, equity, gold, FD, EPF)	None (research tool, not a tracker)	Full (incl. documents/IDs)	None (MF only)
Account Aggregator-based import	None disclosed	Full (stated core mechanism)	Full (stated core mechanism)	Unknown (CAS + broker import, AA not confirmed)	N/A	Unknown (EPF auto-fetch only confirmed)	Unknown
CAS/PDF statement import	Full (core moat)	Partial	Unknown	Full	N/A	None disclosed	Unknown
Capital gains / tax computation (FIFO, grandfathering)	Full (deep)	None disclosed	Unknown	Partial (tax harvesting, ELSS)	N/A	None disclosed	None (advisory ratings, not tax)
Family / multi-member accounts	Full	Full (core feature)	Unknown	Full (family account)	N/A	Full (core feature)	None

Capability	Mprofit	Famli	Passbook.ai	Kuvera	NGEN Markets	Safebox	PowerUp Money
Personalized advice / recommendations	None (descriptive only)	Full (RIA-backed)	Unknown	Partial (RIA-backed, goal recs)	N/A (advisor-facing research)	None (organizational, not advisory)	Full (core product — fund ratings)
Document/ID vault	None	Coming soon	Partial	None	N/A	Full (core feature)	None
Web + mobile parity	Full (web, desktop, iOS, Android)	Mobile only (web "coming")	Unknown	Full	Web (advisor tool)	Mobile only	Mobile only
Regulatory registration	None (relies on MVest partner for MF Central)	SEBI RIA	AMFI MFD	SEBI RIA	N/A	SEBI RIA	SEBI RIA

5. Pricing Comparison

Competitor	Free tier?	Paid tiers
Mprofit	Yes	Lite (\$33) → Plus (\$83) → HNI (~\$250)/yr, custom for advisors
Famli	Yes (early access)	Premium planned, not yet priced
Passbook.ai	Yes (waitlist/early access)	Not yet disclosed
Kuvera	Yes, core features fully free	Monetizes via Surplus (liquid fund float) and partner promotions, not subscriptions

Competitor	Free tier?	Paid tiers
NGEN Markets	No (demo-gated)	Subscription, advisor-facing, price on request
Safebox	Yes	Premium unlocks full family sharing, vault storage, advanced analytics
PowerUp Money	Yes (portfolio review)	PowerUp Elite ₹999/yr

Read: the market has converged on **free core tracking**, monetizing later via premium analytics/family features (Safebox, Mprofit), advisory upsell (PowerUp, Famli), or float/distribution economics (Kuvera). Nobody is charging meaningfully for import/tracking alone anymore — that's table stakes, not a revenue line.

6. Positioning Map

Axes: **(x) Breadth of asset/data coverage** (MF-only → full multi-asset net worth) vs. **(y) Depth of engagement model** (passive tracking → active advice/action).

Broad multi-asset

Narrow (MF-only) | coverage

| Mprofit

| (deep accounting,

NGEN Markets | no advice)

(advisor research |

tool, not retail) | Passbook.ai

| (broadest coverage,

| AA-native, super-app)

|

| Safebox

| (documents + net worth,

| passive, family-focused)

Low advice/action

White space: the upper-right quadrant — broad multi-asset coverage combined with real advice/action — is empty. Famli is closest but still MF/bank/insurance-only, not the full asset universe Mprofit or Passbook.ai cover. Nobody currently pairs *Mprofit-grade accounting depth* with *Passbook-grade AA breadth* and *Famli-grade advisory*, all at once.

7. Competitor Deep Dives

Mprofit — Strength: deepest, most trusted accounting/tax engine in the market (14+ years of per-broker parsing templates). Weakness: import fragility on the long tail of brokers, no AA integration anywhere in public materials, dated tech stack (2018-era Angular/React Native), purely descriptive — zero advisory layer.

Famli — Strength: SEBI RIA-backed from day one, AI-insights framing, genuinely family-first design (not bolted-on). Weakness: narrow asset coverage (no stocks/property/gold explicitly listed), no web app yet, pre-revenue/early-access stage — unproven at scale.

Passbook.ai — Strength: broadest asset coverage of anyone reviewed (chits, crypto, pension — categories nobody else touches), explicitly AA-native which is the most future-proof data-access strategy. Weakness: no public evidence of tax/capital-gains depth; still early-access/waitlist stage; breadth may come at the cost of per-asset accuracy.

Kuvera (by CRED) — Strength: strong brand trust (CRED backing), free, direct-plan-only positioning (no commission drag), decent tax-harvesting tool. Weakness: recent CRED redesign has drawn sustained negative user feedback (removed features, cluttered aggregation, worse UX) — a live cautionary tale about redesigns alienating a loyal base. Primarily a distribution/investing app, not a tracking-first product.

NGEN Markets — Not a direct competitor — B2B institutional research/backtesting tool for advisors (rolling returns, correlation, drawdown analysis, one-click PPT reports). Relevant purely as the likely source for our "advanced analytics dashboard" reference (worth confirming with Ayush).

Safebox — Strength: genuinely differentiated job-to-be-done (document vault + emergency family access + net worth in one place), explicit nomination/succession-gap messaging that nobody else in this set addresses. Weakness: no visible tax/capital-gains capability, no evidence of CAS/AA import (manual entry-heavy), mobile-only.

PowerUp Money — Strength: strong traction (9L+ users, ₹65,000 Cr AUM claimed in 8 months), clean SEBI RIA-backed advisory model (In-form/On-track/Off-track/Out-of-form fund ratings), no-commission positioning. Weakness: MF-only, no multi-asset tracking at all — narrowest scope of anyone in this set.

8. Competitive Gaps and Opportunities

1. **The upper-right whitespace (broad coverage + real advice) is unoccupied.** This is the single clearest strategic opening from this analysis.
2. **Import UX quality is still winnable.** None of the seven publicly emphasize a confidence-scored, review-before-commit import flow — our CAS-parser prototype already has this built.
3. **Family depth is claimed everywhere, proven nowhere.** Famli, Safebox, and Kuvera all say "family" — none show per-member capital-gains/tax rigor at the family level. Our planned "one login → one family → 5 members" needs to go past shared visibility into real per-member accounting to actually differentiate.

4. **Advisory is a regulatory fork, not a checkbox.** Famli, Kuvera, and PowerUp are all RIA-registered specifically to legally give recommendations. If "prescriptive analytics" stays on our roadmap, this needs its own decision doc — pursue RIA deliberately, or stay descriptive-only.
 5. **The Kuvera/CRED redesign backlash is a live lesson**, not just a data point: aggregating everything by default (rather than letting users choose a focused view) actively angered a loyal base. Worth designing our dashboard with a "my platform only" vs. "everything" toggle from day one.
-

9. Strategic Recommendations

1. **Compete head-on with Mprofit on accounting depth** — this is non-negotiable table stakes we're already building (FIFO, XIRR, grandfathering).
 2. **Differentiate via AA-native breadth**, following Passbook.ai's and Famli's lead rather than Mprofit's PDF-first legacy approach — but only once the AA/ARN partnership is live; CAS-PDF remains the honest interim path.
 3. **Do not default-merge all data sources into one undifferentiated view.** Let users see "my direct holdings" vs. "aggregated view," directly addressing the Kuvera/CRED backlash pattern.
 4. **Make the family feature real, not cosmetic** — per-member tax reports, not just a shared dashboard.
 5. **Defer the advisory/RIA decision explicitly** — flag it as a Stage-2 decision requiring its own ADR-style writeup, not something to build into v1 by default.
 6. **Confirm whether NGEN Markets is the actual analytics reference** before building dashboard features against it — it's a plausible match but not yet confirmed by Ayush.
-

10. Sources and Confidence

- **High confidence** (direct from company's own site/app store listing): pricing tiers, regulatory registration numbers, stated feature lists for all 7 competitors.
- **Medium confidence** (inferred from marketing copy, not verified hands-on): actual depth of tax computation, actual AA integration status for Kuvera and Safebox (not explicitly confirmed on their sites, unlike Famli/Passbook.ai).
- **Lower confidence**: Mprofit's current (post-Sept-2025) MF Central usage — flagged previously as needing re-verification; PowerUp's AUM/user claims are self-reported press figures, not independently verified.

No non-public systems, source code, or authentication-gated data were used for any competitor in this analysis.

11. Next Steps

1. Confirm with Ayush: is NGEN Markets the correct "NGEN research website" reference for the analytics dashboard?
 2. Decide whether "prescriptive advisory" stays on the roadmap — if yes, scope the RIA registration conversation now, in parallel with the AMFI MFD path already underway.
 3. Feed the family-depth and import-UX gaps into [define-opportunity-tree](#) next, so they get prioritized against the August MF/equity roadmap rather than added ad hoc.
 4. Awaiting the detailed MF implementation prompt to lock the actual roadmap and timeline, per the prior thread.
-

12. Addendum — Passbook (Family) — newly identified, distinct from Passbook.ai

Important disambiguation: [passbook.family](#) is a **different company** from [passbook.ai](#) (competitor #3 above). They share the "Passbook" name but are unrelated products with opposite architectures — this addendum should not be merged into the Passbook.ai entries elsewhere in this doc.

What they are: A local-first, privacy-first family net-worth app (desktop app for Mac/Windows + a "Passbook Web" browser view). Newly launched (2026), currently on release v1.1.0.

Core architectural difference from everyone else in this analysis: zero central server for financial data. Your data lives in an encrypted SQLite database on your device, with an encrypted backup synced to *your own* Google Drive (ChaCha20 encryption, Argon2id key derivation, hardware-backed key storage via Secure Enclave/TPM). Family sharing works by placing an encrypted copy directly into a family member's own Drive — Passbook's servers only ever see an email address and an anonymized install ID, never financial data. This is a genuinely different trust model from every other competitor in this set (all of which are server/cloud-based), and it's a coherent, well-executed one — not just marketing.

MF import: CAS PDF parsing — same approach we've already built. This is useful external validation that CAS-parsing is the right interim MF strategy, not just our workaround.

Equity/stock import — the part you flagged: implemented via **CDSL** sync (confirmed in their v1.1.0 release notes: "New imports and CDSL syncs auto-link to the right family member by matching PAN, email, or name"). Based on public research into CDSL's consumer-facing

infrastructure, the only legitimate, non-broker-specific access point is **CDSL Easi/Easiest** — a free portal where a user registers with their BO ID (demat account number) + PAN + OTP, and can then view holdings and download a **Statement of Holdings (SOH)** and **Statement of Transactions (SOT)**. This is publicly documented and self-service, structurally identical to how CAMS/MFCentral CAS statements work: the user authenticates directly with the official depository, not through a third party, and generates their own downloadable statement.

Recommended replication path — same trust model as our MF approach, not a new category of risk: build a CDSL SOH/SOT parser exactly like the CAS parser (user downloads their own statement from CDSL Easi/Easiest with their own BO ID/PAN/OTP, uploads it, we parse it). This gives equity holdings without needing broker-specific API deals (Zerodha, Groww, etc. — which remain valuable for real-time/transactional depth later, but aren't the fastest path to basic equity holdings coverage). I don't have confirmation that this is exactly Passbook's mechanism — their technical docs aren't public — but it's the only publicly known safe, self-service CDSL access point, and it's directly analogous to what we already do for MF.

Strategic read: Passbook Family doesn't compete on accounting depth (no visible XIRR/capital-gains rigor beyond basic FIFO realized gains, added only in v1.1.0) — it competes on **trust architecture** and **family emergency-access** (the Vault: documents, passwords, notes, with explicit "what to do in an emergency" framing). This is a third distinct positioning nobody else in this analysis occupies: Mprofit/Passbook.ai/Kuvera compete on data breadth or advice, Safebox is closest analog (documents + net worth) but is cloud-based, not local-first. Worth deciding deliberately whether "your data never leaves your device" is a narrative worth adopting, rather than assuming AWS S3-based cloud storage is the only viable architecture — this is a real fork, not a detail, and it cuts against the S3+Athena direction already in the roadmap doc. Flagging for a conscious decision, not recommending a reversal.
