Mutual Fund Portfolio Analytics

Product Requirement Document for the development team

- 15 analytics attributes, each explained in plain language
- Formula, worked example and screen design for every attribute
- One look-through engine powering the whole dashboard

VERSION
1.0

DATE

AUDIENCE
Product · Engineering · Design

STATUS
For build

What's inside

This document converts the analytics brief into build-ready specifications. Every attribute follows the same four-part layout so a developer, designer and tester can read it the same way.

	WHAT IT MEANS The idea in plain words, as you would explain it to a client.	HOW TO CALCULATE The exact formula and the rules for edge cases.	WORKED EXAMPLE Numbers the developer can use as a test case.	HOW TO SHOW IT The recommended chart, labels and drill-down.
00	The foundation: look-through engine		Architecture	3

00 The foundation: look-through engine

DASHBOARD SECTION
Architecture

Analyse the client's whole mutual fund portfolio as one portfolio, never fund by fund.

THE CORE IDEA

A client may hold 8 to 10 funds and believe they are well diversified. But those funds often buy the same stocks, are run by the same fund manager, or sit with the same AMC. The only way to see the **true** picture is to look *through* every fund to the securities it owns, and add everything up.

THE ONE FORMULA THAT POWERS MOST OF THIS DOCUMENT

Client exposure to a security = $\sum$ over all funds (Fund weight in client portfolio × Security weight inside that fund)

Fund weight = current value of that scheme ÷ total MF portfolio value. Security weight = % of that fund's net assets (from the monthly portfolio disclosure).

Build this once as a shared service. Stock exposure, sector split, market-cap split, asset allocation, overlap, P/E, P/B and concentration alerts all read from the same look-through table instead of each feature doing its own maths.

GOLDEN RULES FOR EVERY SCREEN

- **Weights are always by current market value**, never by amount invested and never a simple average of funds.
- **Every widget shows an 'as on' date**, e.g. *Values as on 29 Sep 2026 · Holdings as on 31 Aug 2026*. Holdings are disclosed monthly, NAVs daily, so the two dates will differ.
- **Every number is clickable**. Standard path: Portfolio → AMC → Fund → Stock / Transaction.
- **Hypothetical numbers are always labelled**. Anything back-tested on current holdings carries a 'Back-tested' tag.
- **Indian formats everywhere**: ₹1,00,000 grouping, lakh/crore short forms (₹50L, ₹1.2Cr), percentages to 2 decimals.

01 Portfolio XIRR

DASHBOARD SECTION
Portfolio Snapshot

The real yearly return the client earned, given exactly when money went in and came out.

WHAT IT MEANS

Simple return only compares 'what I put in' with 'what I have now'. It ignores **time**. XIRR fixes this: money invested three years ago has had more time to grow than money invested last month, and XIRR gives each rupee credit only for the time it was actually invested.

HOW TO CALCULATE

Find the rate r such that: $\sum CF_i \div (1 + r)^{(d_i - d_0) / 365} = 0$

CF = cash flow (purchases and SIPs negative, redemptions and dividend payouts positive, current value positive on the valuation date). d = date. Same result as Excel's XIRR(). Solve with Newton-Raphson, fall back to bisection if it does not converge.

WORKED EXAMPLE (USE AS A UNIT TEST)

Date	Transaction	Cash flow
1 Jan 2023	Lump-sum purchase	-₹1,00,000
1 Jul 2023	Additional purchase	-₹50,000
31 Dec 2025	Current value (valuation date)	+₹1,80,000
Absolute gain · XIRR		₹30,000 (20.00%) · 6.64% p.a.

Notice the gap: the client made 20% in total, but because the money was invested for about three years, the **annual** return is only 6.64%. This is exactly what XIRR should reveal.

HOW TO SHOW IT IN UNIFOLIO

PORTFOLIO XIRR 6.64% p.a. Since first investment · 1 Jan 2023	ABSOLUTE GAIN ₹30,000 20.00% on ₹1,50,000 invested	CURRENT VALUE ₹1,80,000 as on 31 Dec 2025
--	---	--

Cash-flow timeline used for XIRR

Money going in is negative, current value is positive

DRILL-DOWN

Portfolio XIRR → AMC XIRR → Fund XIRR → Transactions

Do not: average the XIRR of individual funds. Put every cash flow of every fund into one list and solve once. Exclude internal switches and STPs at portfolio level (the money never left the portfolio), but keep them at fund level. If the holding period is under one year, show absolute return instead, because annualising a short-term gain exaggerates it.

02

Large / Mid / Small Cap allocation

DASHBOARD SECTION
Portfolio Composition

How much of the client's money finally sits in big, medium and small companies.

WHAT IT MEANS

A fund's name does not tell the full story. A 'Mid Cap Fund' only has to keep 65% in mid caps under SEBI rules, and a Flexi Cap fund can hold anything. So we look at the **actual stocks** inside each fund and classify each stock.

HOW TO CALCULATE

- Step 1 · For each stock, compute client exposure with the look-through formula (page 3).
- Step 2 · Classify each stock using the **AMFI market-cap list**: rank 1–100 = Large, 101–250 = Mid, 251 onwards = Small. AMFI publishes this list every six months, so store the list with its effective date.
- Step 3 · Anything that is not a listed Indian equity (debt, cash, gold, REITs, foreign stocks, unlisted) goes into **Other / Unclassified**.
- Step 4 · Sum by bucket. Provide a toggle: % of total portfolio vs % of equity only.

WORKED EXAMPLE

Fund (share of portfolio)	Large	Mid	Small	Other
Fund A · Flexi Cap (50%) holds 70 / 20 / 10 / 0	35.0%	10.0%	5.0%	0.0%
Fund B · Mid Cap (30%) holds 10 / 70 / 15 / 5	3.0%	21.0%	4.5%	1.5%
Fund C · Small Cap (20%) holds 5 / 20 / 65 / 10	1.0%	4.0%	13.0%	2.0%
Client portfolio	39.0%	35.0%	22.5%	3.5%

Each cell = fund's share of portfolio × fund's bucket %. E.g. Fund B's mid cap: 30% × 70% = 21.0%.

HOW TO SHOW IT IN UNIFOLIO · SAMPLE CLIENT DASHBOARD

Market-cap allocation (look-through)
Based on the stocks inside every fund, not on fund names

- Donut + legend with mini bars. Centre label shows the largest bucket.
- Optional comparison strip: the same split for Nifty 500 so the client sees if they are tilted to small caps.

03

AMC allocation

DASHBOARD SECTION

Composition ·
Concentration

What share of the portfolio each fund house (AMC) is managing.

WHAT IT MEANS

If most of the money is with one AMC, the client is exposed to that fund house's investment style, research team and any operational issue there. This view makes that concentration visible in one glance.

HOW TO CALCULATE

$$\text{AMC allocation \%} = \frac{\sum \text{current value of all schemes of that AMC}}{\text{total MF portfolio value}} \times 100$$

This is a direct grouping of the client's holdings (no look-through needed). Show the top AMCs individually and group the rest into 'Others' (configurable, default top 5).

WORKED EXAMPLE · PORTFOLIO ₹50,00,000

AMC	No. of schemes	Current value	Allocation
SBI MF	2	₹12,50,000	25.00%
HDFC MF	3	₹10,00,000	20.00%
ICICI Prudential MF	2	₹9,00,000	18.00%
Nippon India MF	1	₹7,50,000	15.00%
Others (3 AMCs)	3	₹11,00,000	22.00%
Total	11	₹50,00,000	100.00%

HOW TO SHOW IT IN UNIFOLIO

AMC allocation

Share of total MF portfolio value managed by each fund house

- Sorted horizontal bar chart. Tooltip shows ₹ value and number of schemes.
- Show a soft alert chip when any single AMC crosses a set limit (default 30%, admin configurable): '30%+ of your portfolio is with one AMC'.

DRILL-DOWN

AMC

Schemes of that AMC

Transactions

04 Fund manager allocation

DASHBOARD SECTION
Composition · Concentration

How much of the portfolio is really in the hands of each fund manager.

WHAT IT MEANS

A client can own 8 funds from 3 AMCs and still have half the money managed by one person. Fund-manager exposure reveals this hidden concentration, which is easy to miss because fund names never show the manager.

HOW TO CALCULATE

Manager exposure = $\sum (\text{Fund value} \times \text{Manager's share of that fund}) \div \text{Total portfolio value}$
Manager's share: if a fund has n co-managers, default split = 1/n each. If the data shows roles (e.g. one manages equity, another debt, another overseas), split by the size of the portion they manage.

WORKED EXAMPLE · PORTFOLIO ₹20,00,000

Fund	Value	Managers	Split
Fund X	₹10,00,000	Manager A + Manager B	₹5L to A · ₹5L to B
Fund Y	₹6,00,000	Manager A	₹6L to A
Fund Z	₹4,00,000	Manager B + Manager C	₹2L to B · ₹2L to C
Result	A ₹11L · B ₹7L · C ₹2L		A 55% · B 35% · C 10%

HOW TO SHOW IT IN UNIFOLIO · SAMPLE CLIENT DASHBOARD

- Sorted bar chart; bars in red cross the concentration threshold (default 25%, configurable). 'Others' is never flagged.
- Helper line under the chart: 'Fund Manager A runs 3 of your 9 funds (28% of your money)'.
- Store manager history with start dates, so the screen can also show tenure: 'managing this fund since Mar 2019'.

DRILL-DOWN

Manager → Funds they manage → Holdings

05 Category allocation

DASHBOARD SECTION
Portfolio Composition

How the money is spread across SEBI fund categories.

WHAT IT MEANS

Every mutual fund belongs to a SEBI category such as Flexi Cap, Large Cap or Hybrid. This view shows the client's mix of categories, which is how most advisors first judge whether a portfolio is sensibly built.

HOW TO CALCULATE

Category allocation % = $\Sigma \text{ value of schemes in that category} \div \text{total portfolio value} \times 100$

Read the category from the scheme master. Categories to support: Large Cap, Mid Cap, Small Cap, Flexi Cap, Multi Cap, Large & Mid Cap, ELSS, Value, Contra, Focused, Sectoral/Thematic, Hybrid (with sub-types), Debt (with sub-types), International / FoF, Index Funds & ETFs, Others.

WORKED EXAMPLE

Category	Schemes held	Allocation
Flexi Cap	SBI Flexi Cap, Parag Parikh Flexi Cap	30%
Large Cap	Nippon India Large Cap	20%
Large & Mid Cap	Kotak Large & Midcap, HDFC Large and Mid Cap	15%
Mid Cap	HDFC Mid Cap, Motilal Oswal Midcap	15%
Small Cap	HDFC Small Cap	10%
Hybrid	ICICI Pru Balanced Advantage	10%
Total		100%

HOW TO SHOW IT IN UNIFOLIO

- Sorted bars (better than a pie when there are 8+ categories). Tap a category to see its funds.
- 'Index' is a way of investing, not a SEBI category. Store it as a separate tag (Active / Passive) and offer a filter, so an index large cap fund still counts under Large Cap.

06 Overall stock holdings (look-through)

DASHBOARD SECTION
Composition ·
Concentration

The client's true exposure to each company, added up across all funds.

WHAT IT MEANS

Instead of showing the holdings of each fund separately, we combine them. If three funds all own Reliance, the client sees one line: **their total Reliance exposure**. This is the heart of the product and reveals true stock concentration.

HOW TO CALCULATE

Stock exposure % = $\sum (\text{Fund weight in client portfolio} \times \text{Stock weight in that fund})$
 Stock exposure ₹ = Stock exposure % × Total portfolio value

WORKED EXAMPLE · PORTFOLIO ₹10,00,000

Fund	Fund value	Fund weight	Reliance in fund	Contribution
Fund A	₹4,00,000	40%	8%	$40\% \times 8\% = 3.20\%$
Fund B	₹3,50,000	35%	6%	$35\% \times 6\% = 2.10\%$
Fund C	₹2,50,000	25%	5%	$25\% \times 5\% = 1.25\%$
Reliance Industries · total				6.55% (₹65,500)

Correction to the brief: simply adding $8\% + 6\% + 5\% = 19\%$ is only true if the client had 100% of their money in each fund, which is impossible. The stock weights must always be multiplied by the fund's share of the portfolio first. 6.55% is the correct answer here.

HOW TO SHOW IT IN UNIFOLIO · SAMPLE CLIENT DASHBOARD

Top 10 look-through stock exposures

Each bar is split by the fund that contributes the exposure (tap a bar to drill down)

- Top 10 bars, split by contributing fund; 'View all' opens a searchable table with % and ₹ exposure and sector.
- Match stocks across funds by **ISIN**, not by name ('HDFC Bank Ltd' vs 'HDFC Bank Limited').

DRILL-DOWN

Stock

Funds holding it

Weight in each fund

07

Total expense ratio – portfolio level

DASHBOARD SECTION
Portfolio Snapshot

The average yearly fee on the whole portfolio, and what it costs in rupees.

WHAT IT MEANS

Every fund charges a yearly fee called the Total Expense Ratio (TER). A percentage feels small, so we also convert it into rupees. 'You pay about ₹59,800 a year in fund expenses' is far easier for a client to understand than 1.20%.

HOW TO CALCULATE

$$\text{Portfolio TER} = \frac{\sum (\text{Fund value} \times \text{Fund TER})}{\sum \text{Fund value}}$$

$$\text{Approximate annual expense ₹} = \text{Portfolio value} \times \text{Portfolio TER}$$

WORKED EXAMPLE · PORTFOLIO ₹50,00,000

Fund	Value	TER	Annual cost (value × TER)
Fund A · Flexi Cap	₹15,00,000	1.00%	₹15,000
Fund B · Mid Cap	₹12,00,000	1.50%	₹18,000
Fund C · Large & Mid	₹10,00,000	1.25%	₹12,500
Fund D · Small Cap	₹8,00,000	1.35%	₹10,800
Fund E · Index	₹5,00,000	0.70%	₹3,500
Portfolio	₹50,00,000	1.20%	₹59,800 / year

₹59,800 ÷ ₹50,00,000 = 1.196%, displayed as 1.20%.

HOW TO SHOW IT IN UNIFOLIO

PORTFOLIO EXPENSE RATIO 1.20% weighted by current value	APPROX. ANNUAL EXPENSE ₹59,800 ≈ ₹4,983 per month	HIGHEST-COST FUND Fund B TER 1.50% · ₹18,000 / yr
---	---	---

Where your ₹59,800 annual cost goes

Green = below portfolio average TER, Black = above

Show this note on screen: the expense is already deducted from the NAV daily. It is not an extra bill, but it does reduce returns. Use the latest TER published by the AMC and show its date, since TERs change often.

08

Category average comparison

DASHBOARD SECTION
Performance

Is each fund doing better or worse than similar funds?

WHAT IT MEANS

A 15% return sounds good until you learn that similar funds made 18%. We compare each fund with the average of all funds in its SEBI category, so the client sees whether their fund is actually earning its place.

HOW TO CALCULATE

Difference = Fund metric - Category average

Higher is better for: returns, Sharpe ratio. Lower is better for: TER, volatility, drawdown. Colour logic must flip for the second group.

- Compare like with like: Regular plans vs Regular-plan average, Direct vs Direct.
- Sectoral / thematic funds are compared with their index (e.g. ICICI Pru Technology vs Nifty IT), as in the reference report.

WORKED EXAMPLE · SAMPLE VALUES FROM THE REFERENCE REPORT

Fund / Category average	Amount	1Y	3Y	5Y
Motilal Oswal Midcap Fund	₹1,17,548	-5.69%	20.55%	23.55%
HDFC Mid Cap Fund	₹68,532	7.40%	23.48%	21.14%
Cat Avg: Mid Cap Fund		7.49%	20.84%	17.43%
ICICI Pru Value Fund	₹3,82,714	-0.10%	17.00%	17.05%
Cat Avg: Value Fund		2.48%	17.06%	15.02%

Red = below category average, green = above. Category rows sit directly under their funds, matching the reference layout.

OTHER METRICS ON THE SAME SCREEN

Metric	Fund	Category avg	Display
Expense ratio	1.20%	1.00%	0.20% higher than category
Volatility (3Y std. dev.)	13.1%	14.2%	1.1% lower (better)
Sharpe ratio (3Y)	0.92	0.81	0.11 better
Max drawdown (3Y)	-14.8%	-17.5%	2.7% smaller fall

09

Mutual fund ranking

DASHBOARD SECTION
Performance

A transparent score that ranks each fund against its peers.

WHAT IT MEANS

Ranking tells the client where each fund stands among all funds of the same category, e.g. **'2nd out of 32 large cap funds over 3 years'**. A composite score then combines several factors into one number from 0 to 100. The method must always be visible, never a black box.

HOW TO CALCULATE

- **Peer rank** (per period): sort all funds in the category by return; show position as *rank / total funds*, as in the reference report.
- **Composite score**: convert each parameter into a percentile (0–100) within the category, where 100 = best. For 'lower is better' parameters (volatility, TER, drawdown) reverse the scale. Multiply by weights and add.

Composite score = $0.25 \times 3Y \text{ return} + 0.25 \times 5Y \text{ return} + 0.20 \times \text{category-relative} + 0.15 \times \text{low volatility} + 0.15 \times \text{low TER}$

Default weights shown. Weights and parameters are admin-configurable. If a fund lacks history (e.g. no 5Y), drop that parameter and re-scale the other weights to 100%.

WORKED EXAMPLE · ONE FUND

Parameter	Percentile in category	Weight	Points
3Y return	80	25%	20.0
5Y return	70	25%	17.5
Category-relative performance	75	20%	15.0
Volatility (lower = better)	60	15%	9.0
Expense ratio (lower = better)	40	15%	6.0
Composite score		100%	67.5 / 100

HOW TO SHOW IT IN UNIFOLIO

Fund	Category	1Y	3Y	5Y	Score
Nippon India Large Cap Fund	Large Cap	8/35	2/32	1/29	86
HDFC Mid Cap Fund	Mid Cap	9/30	9/30	5/26	78
Kotak Large & Midcap Fund	Large & Mid	5/32	11/27	10/27	66
Motilal Oswal Midcap Fund	Mid Cap	29/29	22/29	3/25	52
AXIS ELSS Tax Saver Fund	ELSS	30/40	26/38	36/36	18

- Ranks in the bottom half of the category turn red (as in the reference). Scores: 70+ green, 40–69 neutral, under 40 red.
- An 'How is this calculated?' link opens the exact weights used, so the advisor can explain the ranking to the client.

DRILL-DOWN

Ranked list

Fund scorecard

Parameter detail

10 Portfolio overlap

DASHBOARD SECTION
Risk & Concentration

How much the client's funds own the same stocks.

WHAT IT MEANS

Two funds with different names can hold largely the same stocks. Then the client pays two fees for what is almost one fund. Overlap shows this fund by fund, and a concentration view shows how much of the total portfolio sits in just a few stocks.

HOW TO CALCULATE

Overlap (Fund A, Fund B) = Σ over common stocks of min (weight in A , weight in B)

Compute for every pair of funds. The result is symmetric (A vs B = B vs A). Match stocks by ISIN. Suggested bands (configurable): below 20% low · 20–40% moderate · above 40% high.

WORKED EXAMPLE

Common stock	Weight in Fund A	Weight in Fund B	Counted (smaller)
HDFC Bank	9%	7%	7%
Reliance Industries	8%	6%	6%
ICICI Bank	7%	8%	7%
Infosys	6%	5%	5%
TCS	5%	4%	4%
11 other common stocks			13%
Fund A vs Fund B overlap			42%

HOW TO SHOW IT IN UNIFOLIO · REFERENCE DATA

Fund-to-fund overlap heatmap
Darker = more common holdings. 40%+ shown in white bold (reference data)

1. ICICI Pru Tech	—	12%	6%	10%	9%	13%	12%	50%	12%
2. ICICI Pru Value	12%	—	35%	28%	55%	39%	31%	13%	30%
3. SBI Flexi Cap	6%	35%	—	34%	37%	34%	32%	6%	32%
4. Kotak L&M	10%	28%	34%	—	30%	36%	39%	12%	32%
5. Nippon Large Cap	9%	55%	37%	30%	—	51%	33%	10%	37%
6. Axis ELSS	13%	39%	34%	36%	51%	—	37%	15%	37%
7. HDFC L&M	12%	31%	32%	39%	33%	37%	—	11%	51%
8. Tata Digital	50%	13%	6%	12%	10%	15%	11%	—	14%
9. HDFC Multi Cap	12%	30%	32%	32%	37%	37%	51%	14%	—
	1	2	3	4	5	6	7	8	9

Headline under the curve: **'Top 10 stocks represent 38% of your total MF portfolio.'**

Tapping a heatmap cell opens the list of common stocks for that pair; tapping the curve opens the full look-through stock table (page 9).

11

Drawdown – scenario analysis

DASHBOARD SECTION
Risk & Concentration

How the client's current portfolio would have behaved in past market crashes.

WHAT IT MEANS

Clients understand risk best through real events: 'In the COVID crash, this portfolio would have fallen 28% while the Nifty fell 38%, and it would have recovered in about six months.' This page replays the portfolio through a library of historical stress events.

DEFINITIONS

Measure	Formula / meaning
Portfolio fall	$(\text{Lowest value in the window} \div \text{value at start of window}) - 1$
Maximum drawdown	Largest fall from any peak to a later trough inside the window
Recovery period	Days from the trough until the value returns to the previous peak
Difference vs benchmark	Portfolio fall - Benchmark fall (positive = fell less)

TWO CALCULATION MODES (ALWAYS LABEL WHICH ONE IS USED)

- **Actual:** uses the client's real holdings and transactions at that time. Only possible if they were invested then.
- **Back-tested (hypothetical):** takes today's scheme weights and applies each scheme's historical NAV. Tag every number 'Back-tested · not actual performance'. If a scheme did not exist, use its category average as a proxy and show a footnote.

HOW TO SHOW IT IN UNIFOLIO

Scenario (admin-configurable dates)	Portfolio fall	Nifty 50 fall	Difference	Recovery (P / N)
COVID-19 crash · Jan–Mar 2020	-28%	-38%	+10%	180 / 250 days
Rate hikes + Russia-Ukraine · Oct 2021–Jun 2022	-14%	-17%	+3%	120 / 150 days
FPI-led correction · Sep 2024–Mar 2025	-19%	-16%	-3%	In progress
Middle-East / Iran-Israel tension episodes	-6%	-5%	-1%	35 / 30 days

Values above are illustrative placeholders to show the layout; the system computes them from NAV and index data. Keep the scenario list in an admin table (name, start date, end date, benchmark) so new events can be added without code changes.

12

Historical returns + benchmark comparison

DASHBOARD SECTION
Performance

"What if I had held this portfolio for this period?" compared with the market.

WHAT IT MEANS

This answers a simple question for each period: how would this portfolio have done, and did it beat the market? It is shown for 1M, 3M, 6M, 1Y, 3Y, 5Y and since inception.

HOW TO CALCULATE

Absolute return = $(\text{End value} \div \text{Start value}) - 1$ use for periods up to 1 year

CAGR = $(\text{End value} \div \text{Start value})^{1/\text{years}} - 1$ use for periods above 1 year

- 'What if' return = today's scheme weights applied to each scheme's NAV history (back-tested). Show the client's own actual XIRR separately so the two are never confused.
- Use the **TRI (Total Return Index)** version of each benchmark, because fund NAVs include dividends. Offer Nifty 50, Nifty 500, BSE 100 and BSE 500.

WORKED EXAMPLE

Period	Return type	MF Portfolio	Nifty 50 TRI	Nifty 500 TRI	vs Nifty 50
6M	Absolute	7.9%	6.8%	7.4%	+1.1%
1Y	Absolute	12.5%	11.2%	12.0%	+1.3%
3Y	CAGR	15.2%	13.8%	14.5%	+1.4%
5Y	CAGR	16.1%	14.2%	15.0%	+1.9%

Worked check for 3Y: ₹1,00,000 growing to ₹1,52,900 in 3 years $(1.529)^{1/3} - 1 = 15.2\%$ CAGR, while the absolute return is 52.9%. Always show the tag 'Absolute' or 'CAGR' next to the number.

13

Asset allocation within MF portfolio

DASHBOARD SECTION
Portfolio Composition

How much is in equity, debt, gold and cash once we look inside every fund.

WHAT IT MEANS

A hybrid fund is part equity and part debt; an equity fund keeps some cash. So the true asset mix is only visible by looking inside each fund. This is the first view most advisors want, and equity then drills further into market cap, sector and stock.

HOW TO CALCULATE

Asset class % = $\sum$ (Fund weight in portfolio $\times$ Fund's % in that asset class)

Asset classes: Equity (domestic), Equity (international), Debt, Gold / Silver, REITs & InvITs, Cash & equivalents. Use the fund's actual portfolio, not its category. Hedged arbitrage positions can be classed as cash-like (configurable).

WORKED EXAMPLE · PORTFOLIO ₹10,00,000

Fund	Value	Equity	Debt	Gold	Cash
Equity fund (95 / 0 / 0 / 5)	₹6,00,000	₹5,70,000	–	–	₹30,000
Hybrid fund (65 / 30 / 0 / 5)	₹3,00,000	₹1,95,000	₹90,000	–	₹15,000
Gold fund (0 / 0 / 100 / 0)	₹1,00,000	–	–	₹1,00,000	–
Portfolio	₹10,00,000	76.5%	9.0%	10.0%	4.5%

HOW TO SHOW IT IN UNIFOLIO · SAMPLE CLIENT DASHBOARD

Asset allocation with equity drill-down

Inner ring = asset class, outer ring = next level (tap Equity to go to sector → stock)

- Two-ring donut: inner ring = asset class, outer ring = next level. The same numbers appear in a table for accessibility.
- Equity drill-down path: Equity 78% → Large 45% · Mid 20% · Small 13% → Sector → Stock.

DRILL-DOWN Asset class → Market cap → Sector → Stock

14

Investment & withdrawal analysis

DASHBOARD SECTION
Cash Flow & Behaviour

Money in, money out, month by month and year by year.

WHAT IT MEANS

This shows the client's investing behaviour: how regularly they invest, when they withdraw, and how much of the current value is their own money versus growth.

HOW TO CLASSIFY TRANSACTIONS

Transaction type	Portfolio level	Fund level
Purchase, SIP instalment	Investment	Investment
Redemption, SWP	Withdrawal	Withdrawal
Switch in / out, STP	Ignore (money stays in portfolio)	Investment / Withdrawal
Dividend (IDCW) payout	Withdrawal (shown as income)	Withdrawal
Dividend reinvestment	Ignore (no new money)	Ignore

WORKED EXAMPLE

Month	Invest	Withdraw	Net	Year	Invest	Withdraw	Net
Jan	₹2,00,000	₹0	₹2,00,000	2023	₹8L	₹1L	₹7L
Feb	₹50,000	₹0	₹50,000	2024	₹12L	₹2L	₹10L
Mar	₹1,00,000	₹25,000	₹75,000	2025	₹15L	₹3L	₹12L
Q1 total	₹3,50,000	₹25,000	₹3,25,000	Total	₹35L	₹6L	₹29L

HOW TO SHOW IT IN UNIFOLIO

TOTAL INVESTED ₹35.0L since 2023	TOTAL WITHDRAWN ₹6.0L incl. IDCW payouts	NET INVESTED ₹29.0L invested - withdrawn	CURRENT VALUE ₹38.4L as on 29 Sep 2026	ABSOLUTE GAIN ₹9.4L value + withdrawn - invested
---	---	---	---	---

Monthly investment vs withdrawal · 2025

Toggle Monthly / Yearly · tap a bar to see transactions

Gain formula: Absolute gain = Current value + Total withdrawn - Total invested (₹38.4L + ₹6L - ₹35L = ₹9.4L). Also show SIP analysis: active SIPs, total monthly SIP amount, missed instalments.

15

Portfolio P/E and P/B

DASHBOARD SECTION
Portfolio Snapshot

How expensive the stocks inside the portfolio are, compared with the market.

WHAT IT MEANS

P/E (price-to-earnings) and P/B (price-to-book) tell us how richly valued a set of stocks is. Calculated on the look-through equity holdings, they show whether the client's funds are buying expensive growth stocks or cheaper value stocks compared with the Nifty.

HOW TO CALCULATE

$$\text{Portfolio P/E} = 1 \div \sum (w_i \div \text{P/E}_i)$$

$$\text{Portfolio P/B} = 1 \div \sum (w_i \div \text{P/B}_i)$$

w = look-through weight of stock i , re-scaled so equity = 100%. This "harmonic" average equals total market value $\div$ total earnings, which is how index providers compute index P/E.

- Why not a simple weighted average? One stock with P/E 300 would wildly inflate the result. The harmonic method keeps it realistic.
- Loss-making stocks (negative earnings): exclude from P/E and show 'x% of equity excluded (negative earnings)'. Debt, cash and gold are excluded by design.

WORKED EXAMPLE

Stock	Equity weight	P/E	$w \div \text{P/E}$	P/B	$w \div \text{P/B}$
Reliance Industries	10%	24.0	0.00417	2.30	0.04348
HDFC Bank	10%	20.0	0.00500	2.80	0.03571
Infosys	10%	26.0	0.00385	7.50	0.01333
Other stocks	70%	26.0	0.02692	3.40	0.20588
Portfolio (1 $\div$ total)	100%	25.0x	0.03994	3.35x	0.29840

HOW TO SHOW IT IN UNIFOLIO

Metric	MF Portfolio	Nifty 50	Read as
P/E	25.0x	22.8x	Portfolio is ~10% more expensive than the Nifty on earnings
P/B	3.35x	3.10x	Portfolio is ~8% more expensive than the Nifty on book value

Nifty values are illustrative; use NSE's published daily index P/E and P/B.

Recommended dashboard structure

Do not build 15 separate reports. Group everything into five sections so the client moves from 'what do I have' to 'how is it doing' to 'what are the risks'.

1 Portfolio Snapshot The 10-second view on top of the home screen. - Current value - Total invested & withdrawn - Absolute gain & XIRR - Expense ratio & annual ₹ cost - Portfolio P/E & P/B	2 Portfolio Composition What the client owns, after look-through. - Asset allocation - Category allocation - Large / Mid / Small cap - AMC & fund-manager split - Sector & stock allocation	3 Performance How it has done, and against whom. 1M · 3M · 6M · 1Y · 3Y · 5Y - XIRR - Benchmark comparison (TRI) - Category comparison - Fund ranking
4 Risk & Concentration What could hurt the client. - Fund-to-fund overlap - Stock concentration - AMC & manager concentration - Maximum drawdown - Historical scenarios	5 Cash Flow & Behaviour How the client invests over time. - Monthly & yearly flows - SIP analysis - Net investment - Portfolio value growth - Transaction history	+ Global controls Apply to all five sections at once. - Date range & as-on date - Family member / PAN filter - AMC & category filters - Actual vs back-tested toggle - Export client report (PDF)

SAMPLE SNAPSHOT STRIP (TOP OF THE DASHBOARD)

CURRENT VALUE ₹50.0L +₹9.4L gain	XIRR 14.8% p.a. since 2019	EXPENSE RATIO 1.20% ≈ ₹59,800 / yr	P/E · P/B 25.0x · 3.35x vs Nifty 22.8x · 3.10x
---	---	---	---

Interaction rule: every tile, bar, slice and table row opens the next level down (Portfolio → AMC → Fund → Stock / Transaction). A breadcrumb at the top lets the user step back up. Filters at the top (date, family member, AMC) apply to every section at once.

Build conventions, data sources & phasing

Shared rules so every screen behaves the same way, plus the data each feature depends on.

DATA INPUTS

Data	Typical source	Refresh	Used by
Client transactions	RTA consolidated statements (CAMS / KFinTech), platform order book	Daily	01, 12, 14
Scheme NAVs	AMFI daily NAV file	Daily	01, 11, 12
Scheme master: category, AMC, plan, TER	AMFI / AMC disclosures	Daily-monthly	03, 05, 07, 08
Fund managers and roles	Scheme factsheets / SID	Monthly	04
Fund portfolios (stock-level)	AMC monthly portfolio disclosures	Monthly	02, 06, 10, 13, 15
Market-cap classification	AMFI half-yearly list	6-monthly	02, 13
Stock P/E, P/B, sector	Exchange / market data vendor	Daily	06, 15
Benchmark TRI values, index P/E & P/B	NSE / BSE index data	Daily	11, 12, 15

CALCULATION CONVENTIONS

- **Weights:** always by current market value on the valuation date.
- **Returns:** absolute for periods up to 1 year, CAGR above 1 year; label each number with its type.
- **Rounding:** store full precision; round only for display (2 decimals for %, 1 decimal for multiples like P/E).
- **Missing data:** never show 0 for unknown. Show '-' with a tooltip explaining why (e.g. 'Fund launched in 2023, no 5Y history').
- **Like-for-like:** Regular vs Regular, Direct vs Direct, TRI benchmarks vs NAV returns.
- **Configurable, not hard-coded:** alert thresholds, ranking weights, scenario dates, benchmark list and 'Others' grouping size live in an admin panel.

SUGGESTED BUILD PHASES

Phase	Scope	Why first
1 · Core	XIRR, cash-flow analysis, AMC and category allocation, TER, historical returns	Needs only transactions, NAVs and scheme master
2 · Look-through engine	Stock holdings, market cap, sector, asset allocation, overlap, P/E & P/B	One engine unlocks six features
3 · Comparison & risk	Category comparison, ranking, fund-manager exposure, drawdown scenarios	Needs category-wide data and history

Disclaimer text for all analytics screens: Analytics are based on the latest available data from AMCs, AMFI and exchanges. Back-tested and scenario figures are hypothetical and do not represent actual returns. Past performance may or may not be sustained in future. Mutual fund investments are subject to market risks; read all scheme-related documents carefully.
